| Black lemur | $\begin{gathered} \hline \mathrm{AC} 241901, \mathrm{AC} 236691, \\ \mathrm{AC} 236693 \\ \hline \end{gathered}$ | AC237241, AC233592 | DP001278 |
| Lemur | AC239885, AC234681 | AC236570 | DP001282 |

Table S2. Summary of detected conversions in the five human gene clusters.

|  | $\beta$-globin | $\alpha$-globin | CCL | IFN | CYP2abf | Total |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| Number of genes | 5 | 5 | 13 | 17 | 6 | 46 |
| Number of conversion <br> events via criterion 1 | 9 | 6 | 16 | 91 | 36 | 158 |
| Number of conversion <br> events via criterion 2 | 2 | 5 | 8 | 62 | 21 | 98 |
| Number of conversion <br> events via both <br> methods combined | 11 | 11 | 24 | 153 | 57 | 256 |
| Number of paralogous <br> sequence pairs | 29 | 18 | 123 | 644 | 161 | 975 |
| Fraction of pairs <br> showing conversion <br> via criterion 1 | $24.14 \%$ | $22.22 \%$ | $8.13 \%$ | $12.42 \%$ | $18.63 \%$ | $13.44 \%$ |
| Fraction of pairs <br> showing conversion <br> via criterion 2 | $6.90 \%$ | $22.22 \%$ | $6.50 \%$ | $9.32 \%$ | $12.42 \%$ | $9.64 \%$ |
| Fraction of pairs <br> showing conversion at <br> least once | $24.14 \%$ | $38.89 \%$ | $12.20 \%$ | $19.25 \%$ | $25.47 \%$ | $19.90 \%$ |

| Total number of bases <br> in duplications | 12,461 | 11,900 | 290,624 | 204,100 | 206,609 | 725,694 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Fraction of duplicated <br> bases involved in <br> conversion via <br> criterion 1 |  |  |  |  |  |  |
| Fraction of duplicated <br> bases involved in <br> conversion via <br> criterion 2 | $45.18 \%$ | $23.13 \%$ | $8.91 \%$ | $24.33 \%$ | $24.05 \%$ | $18.42 \%$ |
| Fraction of duplicated <br> bases involved in <br> conversion at least <br> once | $58.51 \%$ | $54.20 \%$ | $10.19 \%$ | $44.75 \%$ | $33.57 \%$ | $28.12 \%$ |
| Number of coding <br> exon bases | $71.60 \%$ | $75.03 \%$ | $16.34 \%$ | $50.86 \%$ | $50.62 \%$ | $37.72 \%$ |
| Fraction of coding <br> bases involved in <br> conversion via <br> criterion 1 | 2,220 | 2,142 | 7,887 | 11,040 | 8,922 | 32,211 |
| Fraction of coding <br> bases involved in <br> conversion via <br> criterion 2 | $58.87 \%$ | $1.82 \%$ | $15.38 \%$ | $64.63 \%$ | $20.51 \%$ | $35.78 \%$ |
| Fraction of coding <br> bases involved in <br> conversion at least <br> once | $67.93 \%$ | $51.45 \%$ | $13.29 \%$ | $72.11 \%$ | $29.48 \%$ | $44.24 \%$ |

Criterion 1 signifies events detected by the original triplet or quadruplet tests in Hsu et al. (2010), while criterion 2 is our new complementary method for detecting conversion events covering most or all of an entire paralog. Bases involved in conversion include both donor and recipient regions.

Table S3. Fraction of paralogous pairs by their number of conversion events, out of all paralogous sequence pairs.

|  | $\beta$-globin | a-globin | CCL | IFN | CYP2abf |
| :---: | ---: | ---: | ---: | ---: | ---: |
| 0 | $75.86 \%$ | $61.11 \%$ | $87.80 \%$ | $80.75 \%$ | $74.53 \%$ |
| 1 | $13.79 \%$ | $27.78 \%$ | $7.32 \%$ | $15.53 \%$ | $16.77 \%$ |
| 2 | $6.90 \%$ | $0.00 \%$ | $3.25 \%$ | $3.11 \%$ | $7.45 \%$ |
| 3 | $3.45 \%$ | $11.11 \%$ | $0.81 \%$ | $0.47 \%$ | $1.24 \%$ |
| $>=4$ events | $0.00 \%$ | $0.00 \%$ | $0.81 \%$ | $0.16 \%$ | $0.00 \%$ |

Table S4. Fraction of bases by their number of conversion events (involved as either source or target), out of all bases involved in duplications.

|  | $\beta-$ globin | a-globin | CCL | IFN | CYP2abf |
| :---: | ---: | ---: | ---: | ---: | ---: |
| 0 | $28.40 \%$ | $24.97 \%$ | $83.66 \%$ | $49.14 \%$ | $49.38 \%$ |
| 1 | $39.23 \%$ | $51.40 \%$ | $12.00 \%$ | $23.80 \%$ | $39.12 \%$ |
| 2 | $31.32 \%$ | $9.54 \%$ | $3.20 \%$ | $9.87 \%$ | $9.70 \%$ |
| 3 | $1.00 \%$ | $13.98 \%$ | $0.81 \%$ | $6.54 \%$ | $1.35 \%$ |
| $>=4$ events | $0.05 \%$ | $0.10 \%$ | $0.34 \%$ | $10.65 \%$ | $0.45 \%$ |

Table S5. Hot-spot regions for conversion events. We partitioned each gene cluster into segments using breakpoints from all conversion events, and identified the one showing the most conversion events in each cluster as a "hot-spot" segment. In CCL there was a tie, with four segments having four events each.

| Cluster | Chrom- <br> osome | Start | End | Length | Annotation | Number of <br> events |
| :---: | :---: | :---: | ---: | ---: | :--- | ---: |
| $\beta$-globin | chr11 | 5247854 | 5247859 | 6 | second exon in <br> HBB | 4 |
| a-globin | chr16 | 204195 | 204206 | 12 | intron in HBZ | 4 |
| CCL | chr17 | 34325584 | 34325679 | 96 | intron in CCL15 | 4 |
|  | chr17 | 34341056 | 34341151 | 96 | intron in CCL23 | 4 |
|  | chr17 | 34398281 | 34398353 | 73 | intron and exon <br> in CCL18 | 4 |
|  | chr17 | 34410352 | 34411081 | 730 | no gene | 4 |
| IFN | chr9 | 21239532 | 21239577 | 46 | exon in IFNA14 | 13 |
| CYP2abf | chr19 | 41530849 | 41531369 | 521 | no gene | 5 |

Figure S1. Performance of our CHAP pipeline based on a simulation study.
Simulated sequences mimicking gene clusters in humans, old world monkeys (OWM), and new world monkeys (NWM) were generated using our method from Song et al. (2011), which starts with a 200 kb duplication-free "ancestral" sequence and emulates duplication, conversion, speciation, small substitutions, and purifying selection. Each simulation run included $d$ duplications in the ancestral lineage of the three clades, another $d$ duplications plus $c$ conversions in each lineage between the splits of NWM and OWM from the human lineage, and still another $d$ duplications and $c$ conversions in each lineage after the split of humans and OWM, for $d=\{3,6,9,12,15\}$ and $c=\{2,4,6,8,10\}$ respectively. We generated five replications for each level of evolutionary complexity. Then we ran the CHAP pipeline to detect conversion events in each simulated dataset for values of the criterion selection threshold ranging from $50-100 \%$, and compared its output to the true events known from the simulation process. The results are shown in three plots for (A) sensitivity: the fraction of converted bases detected correctly, (B) FDR (false discovery rate): the fraction of called bases detected incorrectly, and (C) CHAP's run time on a Linux 2.6 .18 machine with a 8 -core Intel Xeon CPU ( 2826 MHz ) and 32 GB of RAM memory. Error bars indicate the standard deviation of the replications at each point.
